                                                                                                                                                                                                                                                                                                                                                                                        The present invention provides the protein and coding sequences of a number of human reproductive system related antigens. These can be used in the prevention and treatment of reproductive system disorders, including cancer. The present sequence is a protein of the invention

```
The invention relates to an isolated nucleic acid comprising any one of CC the 6213 antisense sequences given in the specification where expression CC of the nucleic acid inhibits proliferation of a cell. Also included are: CC (1) a vector comprising a promoter operably linked to the nucleic acid cencoding a polypeptide whose expression is inhibited by the antisense CC nucleic acid; (2) a host cell containing the vector; (3) an isolated CC polypeptide or its fragment whose expression is inhibited by the activity of a gene in an operan required for CC proliferation or the activity of a gene in an operan required for CC proliferation or the activity of a gene in an operan required for CC the gene product or that has an activity against a biological pathway in which a proliferation, or that inhibits cellular proliferation of the biological pathway in which a proliferation required gene or its gene product lies cor a gene on which the test compound that inhibits proliferation of an CC compound's activity; (11) a culture comprising strains in which the gene product is overexpressed or underexpressed; (12) determining the extent to which each of the strains is present in a culture or collection of CC strains; or (13) identifying the target of a compound that inhibits the gene collection of an organism. The antisense nucleic acids required for cellular proliferation to isolate candidate molecules for rational CC drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus S. typhimurium, CC patent did not form part of the nitrated specification, but was obtained this indicated for this
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   21-MAR-2001; 2001US-00815242.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       CC residues in the alpha helix. Each zinc finger can recognise a subsite of allows the recognistion of extended contiguous asymmetric DNA sequences. CC allows the recognise an 18 by sequence, asymmetric DNA sequences. CC for example, a synthetic polydactyl protein containing six zinc finger cdomains can recognise an 18 by sequence, and such proteins are CC domains can recognise an 18 by sequence, and such proteins are CC potentially highly gene-specific. The novel nucleocide-binding zinc. CC finger proteins may therefore be used in the development of artificial CC gene-specific transcriptional regulators. Such transcriptional switches CC may be used to regulate the expression of oncogenes such as erbB-2, CC overexpression of which is involved in malignant transformation. The CC proteins are therefore useful in the treatment of cancers, and may also be used to activate genes involved in fighting diseases, and to treat contain infections by inhibiting the synthesis of viral gene products. They CC may be used in DNA-based diagnostic applications. The proteins may also CC be used in producing functional gene knockout or activation in CC heterozygous transgenic animals. Proteins of the invention can can discoriminate between sequences which have a single base difference. This is manifested in a *100-fold decrease in affinity for the variant CC within the gene transcript, suggesting that information obtained from CC expressed sequence tags may be sufficient for the construction of gene CC switches. Sequences AAB02876-B02869 represent zinc finger alpha helix cc phage library peptides disclosed in the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to an expression of nucleotide sequence that contains sequence 5' (GNN)n-3', in which n is 1-6, is regulated by exposing nucleotide sequence to composition comprising isolated and purified zinc finger-nucleotide binding polypeptide that contains a nucleotide binding region having a sequence of Gly-Cys-Arg-Glu-Leu-Val-Arg. The invention is used in the regulation of the expression of the nucleotide sequence that contains sequence 5' (GNN)n-3'. The present
                             The invention comprises a library of multimeric DNA binding polypeptides (e.g. zinc finger DNA binding polypeptides). The zinc finger binding polypeptides of the invention are useful for sterically occluding the binding stite of a natural transcription factor and enhancing or silencing target gene expression. The present amino acid sequence represents a zinc finger DNA binding peptide of the invention.
                                                                                                                                                                              New zinc finger library of multimeric DNA binding polypeptides, useful for sterically occluding the binding site of a natural transcription factor, and enhancing or silencing target gene expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              library; multimeric DNA binding polypeptide; zinc finger DNA binding peptide; gene expression gene expression enhancement.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence 7 AA;

Novel isolated and purified zinc finger nucleotide-binding proteins with specificity for GNN triplet sequences, useful in gene therapy and for regulating gene function.

Disclosure; Fig 1; 48pp; English.

The invention relates to zinc finger nucleotide-binding proteins which comprise 2-12, preferably 2-6, operatively linked motifs selected from sequences AAB02860-B02875. Sequences AAB02860-B02875 represent the alpha helical regions of zinc finger domains which specifically bind to target nucleotide triplets of the sequence 5'-GNN-3'. Such regions may be linked by the peptide linker TGEKP (AAB02970). The Cys2-His2 zinc finger motif is the most frequently utilised nucleic acid binding motif in eukaryotes, and constitutes a beta-beta-alpha fold. Nucleic acid recognition is

   Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                BG 80

The zinc finger binding polypeptides of the invention are useful for sterically occluding the binding site of a natural transcription factor and enhancing or silencing target gene expression. The present amino acid sequence represents a zinc finger DNA binding peptide of the invention.

CC referred to as ORFX) proteins, polynucleotides at least 85% identical to the ORFX nucleic acid sequences, vectors and host cells comprising ORFX collectively proteins, methods of detecting ORFX proteins, antibodies specific for ORFX proteins, methods of detecting ORFX polynucleotides and collection of ORFX polynucleotides and collectivity, and methods of screening individuals for a predisposition or activity, and methods of screening individuals for a predisposition to an CC ORFX-associated disorder. The ORFX proteins of the invention have a wide creativity, and methods of screening individuals for a predisposition or collectivity, and methods of screening individuals for a predisposition or collectivity, and methods of screening individuals for a predisposition or collectivity, and methods of screening individuals for a predisposition activity, transcripts, activity, themostatic, cell proliferation, collectivity, and methods of cell proliferation, collectivity, and methods of cell proliferation, collectivity, and may also be involved in the determination of other proliferations, fertility and behaviour. ORFX proteins, collectic acids and antibodies may be used in the treatment of cancers, collectic acids and antibodies may be used in the treatment of cancers, collectic acids and benign tumours, collectic acids and antibodies methods of as poortasis and benign tumours, collectic acids may also be used as a correct of primers and probes, in the detection of ORFX genomic sequences correction, and in drug screening. The ORFX proteins may also be used as a mucleic acids may also be used as a mucleic acids. The ORFX proteins may also be used as a mucleic acids and or activity of ORFX proteins may also be used as a mucleic acids.

comprise 2-12, preferably 2-6, operatively linked motifs selected from CC sequences AAB02860-B02875. Sequences AAB02860-B02875 represent the alpha CC helical regions of zinc finger domains which specifically bind to target mucleotide triplets of the sequence 5'-GNN-3'. Such regions may be linked CC is the peptide linker TGEKP (AAB02970). The Cys2-His2 zinc finger motif CC is the most frequently utilised nucleic acid binding motif in eukaryotes, and constitutes a beta-beta-alpha fold. Nucleic acid recognition is CC and constitutes a beta-beta-alpha fold. Nucleic acid recognition is CC and constitutes a beta-beta-alpha fold. Nucleic acid recognition is constitutes a beta-beta-alpha fold. Nucleic acid recognition is constitutes a beta-beta-alpha fold. Nucleic acid recognition acid constitutes a part of the sequences of multiple zinc finger domains constitutes a protein containing of amino acid constitutes in the alpha helix. Each zinc finger can recognise a subsite of allows the recognition of extended contiguous asymmetric DNA sequences. CC for example, a synthetic polydactryl protein containing six zinc finger comains can recognise an 18 bp sequence, and such proteins are contained and the regulators. Such transcriptional switches can recognise an 18 bp sequence, and such proteins are contained to regulators. Such transcriptional switches can be used to activate genes involved in malignant transformation. The contains are therefore useful in the treatment of cancers, and may also be used to activate genes involved in fighting diseases, and to treat contains are therefore useful in the treatment of cancers, and may also be used in producing functional gene producits. They may be used to activate gene producits. They can be achieved by transcription can contain gene producits. They can be used in producing functional gene proteins may also be used in a slot of the invention can contain the proteins of the invention can contain the producits of the invention can contain the producits of the invention and contains t
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    AAB02894

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Query Match
                                                                                                                                                                                                                                                                                       The invention relates to an expression of nucleotide sequence that contains sequence 5'-(GNN)n-3', in which n is 1-6, is regulated by exposing nucleotide sequence to composition comprising isolated and purified zinc finger-nucleotide binding polypeptide that contains a nucleotide binding region having a sequence of Gly-Cys-Arg-Glu-Leu-Val-Arg. The invention is used in the regulation of the expression of the nucleotide sequence that contains sequence 5'-(GNN)n-3'. The present sequence represents the amino acid sequence of a zinc finger binding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Regulating expression of nucleotide sequence that contains sequence 5'-(GNN)n-3', comprises exposing nucleotide sequence to composition comprising isolated and purified zinc finger-nucleotide binding
                                                                                                                                                                                                                 Sequence 7
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       16-OCT-1998;
